No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                          Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbB2) protein (AAW01111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the cDNA sequence code for the intracellular domain (Ly8676-Vaal1555) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral

                                   This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing

```
The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/neu protein. The antignen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly in treating or preventing malignancies in which the HER-2/neu oncogene is associated. Specifically, these are useful for treating or preventing cancer, or so breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/neu protein (also known as pl85 or c-erbB2).
                 New antigen-presenting cells, useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly useful for treating or preventing cancer, e.g. breast cancer

effective for eliciting an immune response. The invention is useful for eliciting an immune response in a patient, where the patient is useful for eliciting an immune response in a patient, where the patient is human leukocyte antigen (HiA)-144 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer, preferably breast cancer, in pharmaceutical compositions, e.g., vaccine and other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a chuman patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the centire Her-2/Neu gene for making the direct expression of a collypeptide in appropriate host cells. The composition is useful in prophylactic or therapeutic applications and for the treatment of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20

904 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or TyrTyrTrpAspGlnAspProProGluArgGlyAlaProProSerThrPheLysGlyThr The present sequence is that of human Her-2/neu oncogene cDNA. The cDNA encodes Her-2/neu (p185), an oncogenic self protein and target for anti-cancer vaccines. The Her-2/neu gene is amplified Her-2/neu; oncogene; cancer; tumour; vaccine; tyrosine kiṇase; receptor; human; gene therapy; gene; ss.

ovarian, colon, lung and prostate cancer. Her-2/new is a member of the tyrosine kinase family of receptor-like glycoproteins. Its overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/new fusion proteins proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of a Her-2/new protein is fused to a Her-2/new intracellular domain or phosphorylatin domain (or its Deltapb fragment). An immune response to Her-2/new protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion proteins, nucleic acids, and isolated content in the fusion proteins, nucleic acids, and isolated content in the development of a necessial for inhibiting the development of a necessial for the animal the fusion proteins of the necessial for inhibiting the development of a necessial for the animal the fusion proteins of the necessial for inhibiting the development of a necessial for the animal the fusion fusion for a necessial for inhibiting the development of a necessial for the animal the fusion for a necessial for inhibiting the development of a necessial for the animal the fusion for a necessial for inhibiting the development of a necessial for the animal the fusion for a necessial for inhibiting the development of a necessial for the animal the fusion for a nec cancers, including breast, cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in a sample to inhibit the development of cancer in a patient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for inhibiting development of haematological malignancy in a patient by administering a polypeptide comprising an immunogenic portion of Her-Zhow or a polypurclectide encoding the polypeptide. Antigen presenting cells that express the protein can also be administered. The sequences are used for inhibiting development of haematological malignancy such as acute myelogenous leukaemia (AML), chronic myelogenous leukaemia (CML), chronic lymphocytic leukaemia (CLL), MDS, myelomas, Hodgkin's lymphoma and non-Hodgkin's lymphoma. This sequence represents DNA encoding human Her-Z/neu

                                                                                                                                             The present sequence encodes a SPLICE erbB-2 receptor protein. The protein has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The erbB-2 polynucleotide is used to construct probes for detecting disorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SPLICE erbB-2 in a sample. Agents (e.g. antisense oligonucleotides) which inhibit the expression of SPLICE erbB-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate SPLICE erbB-2 are useful for treating damaged cells including conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid encoding an erbB 2 receptor protein designated SPLICE erbB-2, inhibitors of the protein are useful for treatment of cancer

This invention describes a novel method for generating a cellular immune response in a patient to a target protein or its fragment. The method involves introducing a vector containing a nucleotide sequence encoding a chimeric immunogen comprising a protein processing signal and the target protein or its fragment. The immunogen is produced by the cells and processed so that the target protein or its fragment is presented to the patients immune system and a cellular immune response is initiated. The method and vectors can be used as a form of vaccination and could be used to generate a cellular immune response in patients to, e.g. cancerous tumours. The cellular immune response is the predominant immune response in the patient. This sequence represents a DNA fragment which encodes the human tumour antigen ErbB-2 described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100

The HER-2 gene also called create and BrbB2, encodes a transmembrane receptor, with tyrosine kinase activity. HER-2 is related to the epidermal growth factor receptor (EGFR or HER-1). Aberrant HER-2 expression is present in a wide number of cancers, especially breast, ovarian and gastric cancers. This sequence is used in the invention to design 12-25 nucleotide oligonucleotides that decrease the expression of human HER-2. The modulating the expression of human epidermal growth factor receptor. The oligonucleotides are used to treat diseases or conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   294

```
The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery endothellum, umbilical artery or vein endothellum, coronary artery andothellum, umbilical artery or vein endothellum, coronary artery andothellum, pulmonary artery conditions and microvascular endothellum, pulmonary artery conditions. The part of pathellum, pronchial epithellum, mammary epithellum, prostate epithellum, renal cortical epithellum, renal proximal tubule epithellum, combilical artery smooth muscle, neonatal dermal fibroblast, pulmonary artery smooth muscle, dermal fibroblast, pulmonary artery smooth muscle, coronary artery smooth muscle, mesangial cells, coronary artery smooth muscle, coronary artery arte

involving alterations of gene expression. The assessment of expression profiles may provide meaningful information with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein
8888
```

888888	expression profile may also be used for creating microarrays. The microarray is useful for genetic and physical mapping of genomes, DNA sequencing, genetic or medical diagnosis, genotyping of organisms, confirming cell or tissue identifications and in identifying promising antibiotics, antiviral or antifungal agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20
                                                                                                                                                                                Human
                                                                                                                                                                                                                                        The invention relates to antisense compounds targetted to a nucleic acid molecule encoding Her2 (human Epidermal Growth Factor receptor 2) that specifically hybridises with and inhibits the expression of Her2. Antisense compounds of the invention are used for treating diseases or conditions associated with Her2 such as hyperproliferative disorders e.g. Lung, breast, gastric, oesophageal, colon, bladder, salivary, neural or cardiac cancer. They are also useful prophylactically e.g. to prevent or delay infection, inflammation and tumour formation. The invention is also used in gene therapy. The present sequence is human

The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human crostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or ibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (I) at least 1 CTL (cytotoxic T-lymphocyte) croup derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used the respective PA and including at least one foreign T helper epitopes of the respective PA and including at least one foreign T helper epitopes of the respective PA and including at least one foreign T helper between are also claimed. The method is used the respective PA and including at least method is used the respective pare and an and an analogue of the respective PA and including at least one foreign to the PA is human pare the pare are also claimed.

of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAi). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            140

target gene by introducing into the cell that contains the target gene target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (dsnal) that has a double stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon Defore introduction of dsnNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) control genes, particularly oncogenes, cytokine genes, Id (not defined) control genes, and genes, and genes expressed in pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsnNA can inhibit expression of the target genes, and the effect is even greater when dsnNA are modified to increase their stability. The invention relates to a transgenic non-human mammal that produces in its mammary gland cells detectable levels of a native human HER2 protein or its fragment. The transgenic animals are useful as tumour models for testing HER2-directed cancer therapies, and for identifying anticancer agents. The animals may also be used as source of cells which can be immortalised in culture, in screening for compounds that have potential as prophylactic or therapeutic treatments of diseases or disorders involving expression of HER2. The anti-cancer molecules are useful for inducing apoptosis or cell death of cancer cells. The present sequence
